WEATHER

Except for a little rain early in the week, it was dry and very mild across the State. Considerable low cloudiness and fog persisted in the eastern half during the latter part of the week. Temperatures averaged from three degrees above normals in the west up to eleven degrees above normals in the east. Precipitation ranged from none in the west up to around a half inch in the southeast and east central portions.

GENERAL

Moisture received during December came mostly as rain and was absorbed into the soil profile, according to the Nebraska Agricultural Statistics Service. Fieldwork activities were very limited due to the damp surface conditions. The lack of snow cover has been a source of concern for winter wheat producers but has been a benefit for livestock care. Most reports indicated that farm stored grains were "storing well." In a few instances, some spoilage and heating in bins was occurring where grain was not "cooled" at harvest time and thereafter. Main activities during December included record keeping and tax planning,

GENERAL (Cont.)

livestock care, moving hay and grain, equipment maintenance, and routine chores.

CROPS

Winter wheat condition was rated at 17% poor, 55% fair, and 28% good. Lack of snow cover remains a concern although moisture received as rainfall and the limited snow melt has improved the producers' outlook. Additional moisture and snow cover continue to be needed in all areas to ensure winter protection and spring growth.

LIVESTOCK

Feed grain supplies as well as hay and forage supplies were rated at mostly adequate across the State. With the open weather, cattle were able to continue gleaning stalk fields and graze winter pasture longer than usual and this has lessened the amount of supplemental feeding required. The reduced feeding requirements during December has taken the pressure off hay and forage supplies in some areas. Feedlots are muddy but are improving.
